Unit 4 Group Progress Checkpoint: Final Assessment Readiness

Unit 4 Group Progress Checkpoint: Final Assessment Readiness

Purpose of This Checkpoint

This checkpoint is used to confirm that your group has completed the development and integration work required for the final assessment.

You are not creating new documents at this stage. Review, correct and organise the work completed in Unit 4.

Your group must be able to demonstrate that the Flutter mobile application and ASP.NET web application use the same Supabase backend and support the approved stakeholder requirements.

What Your Group Must Have Ready

Item	What should be complete
Shared Supabase Backend	Required database tables, fields, keys and relationships
Authentication and User Access	Sign-in and access permissions, where required
Flutter Mobile Application	Main approved mobile screens and functions
ASP.NET Web Application	Main approved web pages and functions
Application Integration	Both applications connected to the same Supabase project
Shared Processes	At least two important processes working across the applications
Updated SRS	Approved implementation changes recorded where necessary
Microsoft Project	Updated to reflect development progress
GitHub	Current mobile and web source code

Project Progress Tracker	Current tasks, contributions, challenges and group reflection
Final Demonstration	Working prototype ready to present to the assessment panel

Check the Shared Supabase Backend

Confirm that:

- the required database tables and fields have been created;
- primary and foreign keys are correctly configured;
- relationships follow the approved ERD;
- authentication is configured where required;
- appropriate user access permissions are in place;
- the database can save, retrieve and update the required information; and
- both applications use the same Supabase project.

Check the Flutter Mobile Application

Confirm that:

- the application launches successfully;
- the main approved screens have been developed;
- navigation between screens works;
- forms capture the required information;
- the main mobile functions work;
- the application can save and retrieve information through Supabase; and
- the implemented functions match the approved SRS.

Check the ASP.NET Web Application

Confirm that:

- the application launches successfully;
- the main approved web pages have been developed;
- navigation between pages works;
- forms capture the required information;
- the main web functions work;
- the application can retrieve and update information through Supabase; and
- the implemented functions match the approved SRS.

Check the Integration of the Applications

Your group must be able to demonstrate at least two important shared processes.

Confirm that:

- Flutter and ASP.NET connect to the same Supabase backend;

- information entered through one application can be retrieved through the other, where required;
- updates made through one application are reflected when the other retrieves the information;
- both applications use consistent database fields and values; and
- users can access only the functions and information permitted by their roles.

Use the table below to review your shared processes.

Shared process	**Flutter action**	**ASP.NET action**	**Working?**
Example: Appointment request	Customer submits a request	Staff view the request	
Example: Appointment approval	Customer views the updated status	Staff approve the request	
Your process 1			
Your process 2			

Use processes from your own stakeholder project. The salon example only shows how the table should be completed.

Check Alignment With the Approved Requirements

Use this table to confirm that your implemented functions match your SRS.

Approved requirement	**Application**	**Implemented function**	**Working?**
Example: Submit Appointment	Flutter	Appointment request form	
Example: Approve Appointment	ASP.NET	Approve appointment function	

If an important approved requirement has not been implemented, identify the outstanding work. Do not describe an incomplete function as fully working.

Record any approved changes to the requirements or design in your existing SRS.

Check Outstanding Development Problems

Review any problems identified while developing and connecting the applications.

Problem or outstanding task	Action required	Responsible member	Status

Confirm that:

- important development problems have been addressed where possible;
- any remaining limitations have been recorded;
- outstanding work has been assigned to group members; and
- Microsoft Project and the Project Progress Tracker reflect the current situation.

You do not need to prepare a formal test plan, test cases or a defect log for this checkpoint.

Check Your Final Demonstration

Before the assessment, make sure your group can demonstrate:

1. The Flutter mobile application running.
2. The ASP.NET web application running.
3. The main approved functions in each application.
4. Both applications connecting to the shared Supabase backend.
5. At least two important processes involving both applications.
6. Information being saved, retrieved or updated correctly.
7. The current state of the project, including any known limitations.

Use suitable dummy data during the demonstration. Ensure that the applications and any required development tools are ready before your allocated presentation time.

Check Your Project Records

Make sure the following are current:

- Updated SRS;
- Microsoft Project, including the original editable file;
- GitHub repository, including mobile/ and web/;
- Project Progress Tracker;
- Task Progress;
- Individual Contributions;
- Challenges and Actions;
- Phase Summary; and

- Group Reflection.

Keep appropriate screenshots or short recordings of the main working functions and integrated processes as supporting evidence.

Before Moving On

Confirm that:

- the shared Supabase backend is implemented;
- the main Flutter screens and functions are working;
- the main ASP.NET pages and functions are working;
- both applications use the same Supabase project;
- at least two important shared processes can be demonstrated;
- the implemented functions align with the approved requirements;
- remaining limitations are recorded;
- the updated SRS reflects approved changes;
- Microsoft Project is current;
- GitHub contains the latest source code;
- the Project Progress Tracker is complete; and
- the group is prepared to demonstrate and explain its prototype.

Your group is now ready for:

Assessment 3: System Development, Implementation and Final Demonstration (50%).
